Covariant return type

-> covariant return type means if method return type is non-primitive data member then we can return same or it's sub class object.

```
☑ A.java

                                                       29
                                                                   return c; // we can return c
  6
                                                        30
                                                               }
                                                        31
```

What is non-primitive type casting?

- -> conversion of one data member into another data member known as type casting
- -> there are two types of type casting is present upcasting and down casting

What is upcasting?

- -> conversion of lower data member (B) into higher data member (A) known as upcasting
- -> for upcasting we don't need to perform any changes in code explicitly

```
☑ Test.java 
☒
  1 package com.cjc1;
    public class Test (
  5⊜
        public B m1() {
            Bb = new B();
  6
  7
            return b;
  8
        }
  9
10⊜
        public static void main(String[] args) {
11
12
            Test t = new Test();
13
14
            A \quad a = t.m1();
15
16
            System.out.println(a.x);
17
        }
18 }
19
```

What is down casting?

- -> conversion of higher data member (A) into lower data member known as down casting
- -> to perform down casting we need to perform change in code explicitly

```
☑ Test.java 
☒

  1 package com.cjc1;
  2
  3 public class Test {
  4
  5⊜
        public A m1() {
  6
  7
            Bb = new B();
  8
  9
            return b;
        }
10
11
12º
        public static void main(String[] args) {
13
14
            Test t = new Test();
15
           B b = (B) t.m1();
16
17
18
             System.out.println(b.y);
19
        }
20 }
21
```

Note* type casting cannot happen in between classes that has no parent and child relationship with each other

Object example

```
1 package com.cjc1;
  2
  3 public class Test {
  4
  5⊜
       public Object m1() {
  6
  7
           return "ABC";
  8
       }
  9
10⊝
       public static void main(String[] args) {
          System.out.println("main---start");
11
12
13
           Test t = new Test();
14
           String i = (String) t.m1();
15
16
           System.out.println("main---ends");
17
       }
18 }
19
```
